

Method (10 marks max)	Critical Analysis (10 marks max)	Report Quality (5 marks max)
2 marks • Research questions are clearly formulated, testable, neither too narrow nor too broad, and show a high degree of innovation • System design is admirably clear and unquestionably structured to provide testable hypotheses which will provide evidence toward the specified research question • Demonstrates a comprehensive understanding of the dataset's characteristics, nuances, and potential biases. Clearly justifies the dataset choice and links it back to the problem/RQs. Performs interesting, novel and effective feature/ sample manipulation and clearly justifies it linking to RQs, dataset/model properties and results. • Utilises relevant methodological strategies which are very clearly connected to the research questions and data • Evaluation methods are clearly justified, and evaluation is logical, rigorous and thorough enough to clearly support or reject the tested hypotheses	2 marks • Clearly identifies the knowledge gained about the task, explains limitations and shows an attempt to overcome them • Argumentation is logical and incontrovertibly supported by evidence • Theoretical properties of methods are well-understood and linked to practical observations; implications are discussed in depth and supported by specific examples • Demonstrates a very high level of abstract thought • Admirably situated with respect to the academic community	1 mark • Ideas and arguments are cohesive, where the components of the report clearly indicate how they relate to the whole • Report structure is logical and formal, in line with typical standards in academic writing and ACL format • Very clear and easy-to-follow • References are suitably synthesised and chosen discriminately with respect to the given problem • Uses multiple, well-chosen visuals that clearly communicate trends and strengthen arguments. Visuals integrate smoothly with the discussion and effectively emphasise key insights.
1.5 marks • Research questions are clearly formulated, testable, neither too narrow nor too broad, and show a some degree of innovation • System design is clear and reproducible, but some minor ideas are overlooked	1.5 marks • Clearly identifies the knowledge gained about the task, but lacks the attempt to overcome limitations • Argumentation is logical and thoroughly supported by evidence	

• Demonstrates a good understanding of the dataset's characteristics and potential biases, but may omit some nuances. Justifies the dataset choice and links it back to the problem/RQs. Performs some feature/sample manipulation and links it to the dataset properties/RQs, but not necessarily results and analysis. • Utilises relevant methodological strategies which are connected to the research questions and data • Evaluation is systematic and logical but may lack thoroughness •	• Theoretical properties of methods are well-understood and linked to practical observations, but may lack depth of analysis and examples • Demonstrates a moderate level of abstract thought • Attempts to situate with respect to the academic community, but perhaps not clearly	
1 mark • Research questions are clearly formulated, testable, neither too narrow nor too broad, but not particularly innovative • System design is missing some important idea, making the design questionable or dubious • Demonstrates a good understanding of the dataset's characteristics, nuances, and potential biases, but lacks a clear justification or link to the problem/RQs. • Utilises relevant methodological strategies which are somewhat connected to the research questions and data • Evaluation is logical but not systematic	1 mark • Attempts to identify the knowledge gained about the task, but vague or unclear • Argumentation is logical, but evidence is lacking in some areas • Theoretical properties of methods are understood, but not clearly linked to practical behaviour • Demonstrates abstract thought, but extended analysis not always clear or successful • Little connection to the academic community	• 0.5 marks • Ideas and arguments are mostly coherent, but do not come together in a unified way • Report structure is logical, but possibly informal or out of line with academic standards. ACL format is not followed. • Some unclear parts that do not detract from the overall work • References are present, but terse or disconnected from the problem at hand • Provides some charts or tables, but selection or presentation is limited. Labels or captions may be unclear, and visuals only partially relate to insights. Discussion references visuals superficially without detailed interpretation.
0.5 marks	0.5 marks	

• Research questions are unclear and/or not testable, and/or too narrow or too broad • Shows only basic understanding of the dataset but misses some key aspects; preprocessing/feature engineering attempted but trivial. • System design lacks several crucial methodological components • Utilises methodological strategies, but they are disconnected from research questions, or fundamentally limit the prospect of gaining knowledge • Evaluation is attempted but illogical •	• Knowledge gained about the task is fundamentally flawed or lacking • Argumentation is illogical in places, and evidence is inadequate or contradictory • Theoretical properties of methods are poorly understood and misinterpreted • Lacks abstract thought and/or analysis • Unclear or poor connection to the academic community	
0 marks • Research questions are incomprehensible or absent • No attempt of system design • Little understanding of relevance or effect of the dataset on analysis outcomes; no dataset description or attempt to do preprocessing or feature manipulation. • Methodological strategies are incomplete or absent • No evaluation or it doesn't meet minimum criteria (3 methods)	0 marks • No indication of knowledge gained about the task • Argumentation is generally absent • Theoretical properties of methods are not referred to • Mostly data without corresponding analysis • No connection to the academic community	0 marks • Ideas and arguments are notably incoherent • Report structure is severely flawed or has no structure • Some unclear parts which detract from the overall work • References do not meet the minimum amount criteria (2) or are irrelevant; the dataset is not cited; references do not exist • No visualisations or they don't make sense

Additional marks can be deducted for not following assignment requirements (dataset fabricated, not enough research questions, etc).
